

## HOW TO APPLY HTML CODES AND COLORS

With HTML, the user creates tags; tags are anything between the less-than and the greater-than signs. Using the tags, this identifies where the commands begin and end. For example, `<b>Bold Text</b>` tells the browser that `<b>` is the beginning of the bold text statement that will turn anything after that tag bold; once the browser hits `</b>` the browser then turns the bold text statement off, allowing for only specific text to be bold

`<B>` - Tells the browser to display the text within the HTML tags to be bold.

**Example:** `<B>This text would be in bold</B>`

**Preview:** This text would be in bold

`<I>` - *Italicizes* the text.

**Example:**`<I>Italic Text</I>`

**Preview:** *Italic Text*

`<FONT>` - Allows you to have multiple fonts, colors and sizes.

**Example1:** `<FONT size=+2>This text would be two times bigger.</FONT>`

**Example2:** `<FONT COLOR="BLUE">This text would be blue.</FONT>`

**Example3:** `<FONT COLOR="RED">This text would be red.</FONT>`

**Example4:** `<FONT COLOR="YELLOW">This text would be yellow.</FONT>`

**Example5:** `<FONT COLOR="GREEN">This text would be green.</FONT>`

**Preview1:** This text would be two times bigger.

**Preview2:** This text would be blue.

**Preview3:** This text would be red.

**Preview4:** This text would be yellow.

**Preview5:** This text would be green.

`<BIG>` - HTML 3.0 tag which allows your text to be BIG.

**Example:** `<BIG>This text would be big.</BIG>`

**Preview:** This text would be big.

**Example:** `<BIG><BIG>This text would be bigger.</BIG></BIG>`

**Preview:** This text would be bigger.

`<P>` - Tells the browser that this is the end of the paragraph and will not attempt to word wrap it.

**Example:** `<P>Location for the paragraph to begin and end.</P>`

**Preview:**

Location for the paragraph to begin and end.
